ABSTRACT

The interaction between species has been a long standing scientific research both for mathematical ecologists and environmental statisticians, biologists or scientists to mention a few. In the present study activity we have indentified the full potential of using a numerical simulation which is computationally efficient to differentiate types of stability due to a variation of a co- existence steady state solution. The novel results which we have achieved on the implementation of this method have not been seen elsewhere; they are presented and discussed in this paper.

Keywords: species, interaction, environmental, numerical simulation, steady state

1. INTRODUCTION

The interaction between two populations dates back to the earlier formulation of Lotka-Volterra system of continuous non-linear first order ordinary differential equations. In the theory of competing species, the co-existence steady state solution plays a significant role in the survival of two competing species (Burden and Faires, 2001). Since such a steady state solution is a point in the phase plane, varying one co-ordinate and fixing the other co-ordinate can have an impact on the type of stability for the two competing species. This proposed idea cannot be successfully tackled using an analytical method. Therefore, for the purpose of this study, we have utilized the method of a numerical simulation to quantify the impact of one co-ordinate of co-existence steady state solution on the type of stability.

2. MATHEMATICAL FORMULATION

Following (Murray, 2001, Yan and Ekaka-a, 2001, Ford *et al.*, 2010, Kot, 2001, Beeby, 1993). We have considered the following system of continuous non-linear first order differential equation;

$$\frac{dx-1(t)}{dt} = x-1(t)(4-0.0003x-1(t)-0.0004x-2(t)) \quad (1)$$

$$\frac{dx-2(t)}{dt} = x-2(t)(2-0.0002x-1(t)-0.0001x-2(t)) \quad (2)$$

Subject to the ordinary initial conditions $x_1(0) = x_{10} > 0$ and $x_2(0) = x_{20} > 0$

Method of Analysis

We have obtained a co-existence steady state solution (8000, 4000) by using the standard analytical method of Cramer's Rule to solve the above equations (1) and (2). This steady state solution indicates that for the two competing species to survive together, x_1 species will have a population size of 8000 whereas the x_2 species will have a population size of 4000. For the purpose of this study, we first fixed x_2 population size and vary the x_1 population size and using this variations to study the stability of the expected co-existence steady state solution. Secondly, we fixed x_1 population size and vary x_2 population size and similarly study the stability of the co-existence steady state solution. The results that we have obtained on the application of this method are presented and discussed below.

3. RESULTS AND DISCUSSIONS

The results that we have obtained upon the implementation of the above method of analysis are fully presented and discussed in this section.

Table 1 Evaluating the impact of x_1 between 800 and 4400 on the type of stability

| Example | x_1 | x_2 | Eigenvalue λ_1 | Eigenvalue λ_2 | Type of stability |
|---------|-------|-------|------------------------|------------------------|-------------------|
| 1 | 800 | 4000 | 2.1505 | 0.8095 | Unstable |
| 2 | 1200 | 4000 | 2.0367 | 0.8095 | Unstable |
| 3 | 1600 | 4000 | 1.9284 | 0.3916 | Unstable |
| 4 | 2000 | 4000 | 0.1754 | 1.8246 | Unstable |
| 5 | 2400 | 4000 | 1.7245 | -0.0445 | Unstable |
| 6 | 2800 | 4000 | 1.6274 | -0.2674 | Unstable |
| 7 | 3200 | 4000 | -0.4927 | 1.5327 | Unstable |
| 8 | 3600 | 4000 | -0.7200 | 1.4000 | Unstable |
| 9 | 4000 | 4000 | -0.9489 | 1.3489 | Unstable |
| 10 | 4400 | 4000 | -1.1792 | 1.2592 | Unstable |

What can we learn from Table 1? From Table 1, the ten empirical examples of the two steady state solutions (x_1, x_2) are unanimously unstable having two positive eigen values and eigen values of opposite signs. By the mathematical concept of a quantitative behavior of solution trajectories, two positive eigen values contribute to the unbound growth of the solution trajectories

(hence the steady state solution is said to be unstable). In this context, two eigen values of opposite signs signify that the positive eigen value is growing unbound and faster than the negative eigen value that is contributing to the decaying behavior of the solution trajectories. A similar observation has been made for Table 2.

Table 2 Evaluating the impact of x_1 between 4800 and 8400 on the type of stability

| Example | x_1 | x_2 | Eigenvalue λ_1 | Eigenvalue λ_2 | Type of stability | |
|---------|-------|-------|------------------------|------------------------|-------------------|----------|
| 1 | 1 | 4800 | 4000 | -1.4106 | 1.1706 | Unstable |
| 1 | 2 | 5200 | 4000 | -1.6429 | 1.0829 | Unstable |
| 1 | 3 | 5600 | 4000 | -1.8761 | 0.9961 | Unstable |
| 1 | 4 | 6000 | 4000 | -2.1100 | 0.9100 | Unstable |
| 1 | 5 | 6400 | 4000 | -2.3444 | 0.8244 | Unstable |
| 1 | 6 | 6800 | 4000 | -2.5794 | 0.7394 | Unstable |
| 1 | 7 | 7200 | 4000 | -2.8148 | 0.6548 | Unstable |
| 1 | 8 | 7600 | 4000 | -3.0506 | 0.5706 | Unstable |
| 1 | 9 | 8000 | 4000 | -3.2868 | 0.4868 | Unstable |
| 2 | 0 | 8400 | 4000 | -3.5233 | 0.4033 | Unstable |

However, the co-existence steady state solutions continue to be unstable up to the steady state solution (10000, 4000), after which the instability is lost (Table 3 & 4). From our analysis, we have observed that the instability is lost between the steady state solutions (10000, 4000) and (10200, 4000). After this bifurcation phase, each steady state solution is consistently stable having two negative eigen values that contribute to the decaying behavior of the solution trajectories of $x_1(t)$ and $x_2(t)$.

Table 3 Evaluating the impact of x_1 between 8800 and 11800 on the type of stability

| Example | x_1 | x_2 | Eigenvalue λ_1 | Eigenvalue λ_2 | Type of stability | |
|---------|-------|-------|------------------------|------------------------|-------------------|----------|
| 2 | 1 | 8800 | 4000 | -3.7600 | 0.3200 | Unstable |
| 2 | 2 | 9200 | 4000 | -3.9978 | 0.2370 | Unstable |
| 2 | 3 | 9600 | 4000 | -4.2342 | 0.1542 | Unstable |
| 2 | 4 | 10000 | 4000 | -4.4716 | 0.0716 | Unstable |
| 2 | 5 | 10200 | 4000 | -4.7091 | -0.0109 | Stable |
| 2 | 6 | 10400 | 4000 | -4.9468 | -0.0932 | Stable |
| 2 | 7 | 10800 | 4000 | -5.1847 | -0.1753 | Stable |
| 2 | 8 | 11200 | 4000 | -5.4227 | -0.2573 | Stable |
| 2 | 9 | 11400 | 4000 | -5.6608 | -0.3392 | Stable |
| 3 | 0 | 11800 | 4000 | -5.8991 | -0.4209 | Stable |

Table 4 Evaluating the impact of x_1 between 12800 and 16400 on the type of stability

| Example | x_1 | x_2 | Eigenvalue λ_1 | Eigenvalue λ_2 | Type of stability | |
|---------|-------|-------|------------------------|------------------------|-------------------|--------|
| 3 | 1 | 12800 | 4000 | -6.1374 | -0.5026 | Stable |
| 3 | 2 | 13200 | 4000 | -6.3758 | -0.5842 | Stable |
| 3 | 3 | 13600 | 4000 | -6.6143 | -0.6657 | Stable |
| 3 | 4 | 14000 | 4000 | -6.8529 | -0.7471 | Stable |
| 3 | 5 | 14400 | 4000 | -7.0915 | -0.8285 | Stable |
| 3 | 6 | 14800 | 4000 | -7.3302 | -0.9098 | Stable |
| 3 | 7 | 15200 | 4000 | -7.5690 | -0.9910 | Stable |
| 3 | 8 | 15600 | 4000 | -7.8078 | -1.0722 | Stable |
| 3 | 9 | 16000 | 4000 | -8.0467 | -1.1533 | Stable |
| 4 | 0 | 16400 | 4000 | -8.2857 | -1.2343 | Stable |

What is our next task? Having varied x_1 and fixed x_2 to construct several steady state solutions that were unstable (dominant) and stable in the minor, we would like to explore further on the variation of x_2 while x_1 is fixed. The results of this new idea are shown in Tables 5-8.

Table 5 Evaluating the impact of x_2 between 400 and 2200 on the type of stability

| Example | x_1 | x_2 | Eigenvalue λ_1 | Eigenvalue λ_2 | Type of stability |
|---------|-------|-------|------------------------|------------------------|-------------------|
| 1 | 8000 | 400 | -1.1358 | 0.4958 | Unstable |
| 2 | 8000 | 600 | -1.2853 | 0.5253 | Unstable |
| 3 | 8000 | 800 | -1.4271 | 0.5471 | Unstable |
| 4 | 8000 | 1000 | -1.5630 | 0.5630 | Unstable |
| 5 | 8000 | 1200 | -1.6942 | 0.5742 | Unstable |
| 6 | 8000 | 1400 | -1.8215 | 0.5815 | Unstable |
| 7 | 8000 | 1600 | -1.9455 | 0.5855 | Unstable |
| 8 | 8000 | 1800 | -2.0668 | 0.5856 | Unstable |
| 9 | 8000 | 2000 | -2.1856 | 0.5856 | Unstable |
| 10 | 8000 | 2200 | -2.3024 | 0.5824 | Unstable |

Table 6 Evaluating impact of x_2 between 2400 and 4200 On the type of stability

| Example | x_1 | x_2 | Eigenvalue λ_1 | Eigenvalue λ_2 | Type of stability |
|---------|-------|-------|------------------------|------------------------|-------------------|
| 1 | 8000 | 2400 | -2.4172 | 0.5772 | Unstable |
| 2 | 8000 | 2600 | -2.5304 | 0.5704 | Unstable |
| 3 | 8000 | 2800 | -2.6420 | 0.5620 | Unstable |
| 4 | 8000 | 3000 | -2.7523 | 0.5523 | Unstable |
| 5 | 8000 | 3200 | -2.8613 | 0.5413 | Unstable |

What contribution has the present analysis made over the earlier formulation? While the original formulation simply described the deterministic interaction between two competing species, the in-depth study of the impact of the co-existence steady state solution on the type of stability was not considered. In order to extend this idea, we have utilized a sound mathematical reasoning to investigate the effect of the co-existence steady state solution on the type of stability. On the basis of this present analysis, we can clearly mention that the present numerical analysis is a cutting edge contribution over the previous mathematically track-table and ecological track-table system of competing species.

4. CONCLUSION AND FURTHER RESEARCH

The key achievement of this important study depends on its significance contribution: we have utilized the method of numerical simulation to clearly study the effect of varying the co-existence of the steady state solution on the type of stability. In particular when the x_1 population size is varied for a fixed x_2 population size, we have found several significant dominant unstable steady state solutions that consequently change to a few instances of stable co-existence steady state solutions. This aspect of bifurcation analysis has the potential to influence ecosystem functioning, planning and sustainable development. The full details of other parameter variations in the context of pure competition and other types of interactions such as mutualism, commensalism and predation will be the subjects of our further research.
